## LDRD Project Data Sheet - FY15

**Project ID:** FNAL-LDRD-2015-020

**Project title:** Off-the-Shelf Data Acquisition System

**Principal investigator:** Ryan Rivera

**Project description:** (short description and explanation of cutting edge, high-risk, high-potential science or engineering)

Define and evaluate a low-cost, scalable data acquisition (DAQ) system architecture based on commercial technology being developed for the emerging “Internet of Things” (IoT). This approach connects intelligent front-end digitizers directly to a standard network which is used for data acquisition, event building, detector controls, online and offline data storage/processing, and control room interfaces. The system is scalable from a few MBytes/sec to hundreds of GBytes/sec using inexpensive commodity networking equipment and interface modules.

**Tie to Mission:** (explain the project’s relevance or anticipated benefits to Fermilab’s and DOE’s missions)

A wide range of experiments and test beam studies rely on data acquisition systems that in the past were often based upon relatively expensive and short-lived technologies. As experiments are reluctant to subsidize the development of niche standards, an off-the-shelf DAQ enabled by the IoT has the potential to satisfy the requirements of a large range of experiments and studies at a very modest cost.

**Previous year’s accomplishments:** (as applicable)

A number of software tasks have been completing including evaluation of web server infrastructure, developing a generic UDP receiver framework for artdaq, developing a web interface infrastructure. Several proof-of-concepts have been demonstrated such as compatibility with Fermilab passwords, widgets in JavaScript, and a website interface. A number of hardware tasks have been completed. Ethernet FPGA code has been added to various interfaces. The performance of the low-end candidate has been characterized. The mid and high-end candidates for evaluation have been selected. Several proof-of-concepts have been demonstrated. Much of the recent work has been to achieve the minimum viable product beginning at the website and communication with hardware through a GUI.

**Work proposed for current fiscal year and anticipated / desired results:**

The Minimum viable product will continued to be refined. A number of interested users including the test beam facility users, LCLS-II work, CMS HGAL and outer tracker have been identified. There is a balance between working towards refined development and supporting initial users. This balance will be evaluated and the project will be brought to completion and taken over by user demand.

**Project funding profile:** (costs, budgets, projected budgets, and total)

Prior year(s) costs	FY15	FY16	FY17	Total
N/A	264640	173978	151000	589,618

Project Start Data: 2/1/2015 (est) Total Approved Project funds: \$ 589,660
